The invention defined in independent claim 1 relates to a process for successively washing raw sulphate pulp in a first and a second washer and wherein the washing liquid exiting the second washer is partially purified of "extractives and metals" and subsequently recycled to the first washer.

According to the characterising portion of this claim, the washing liquid exiting the second washer is split up into a first and a second stream, the second stream is purified by acid-induced precipitation of the "extractives and metals" in the form of a "sludge" and subsequent removal of the precipitate, the purified second stream and the unpurified first stream are recombined, and the partially purified washing liquid thus obtained is subsequently recycled to the first washer.

The merits of the procedure to be followed according to the characterising portion of independent claim 1 are apparent from the description, page 1, paragraph 1 to page 2, paragraph 2.

No disclosure can be found in the documents cited in the search report of a method as defined in claim 1, let alone any technical information which might have made foreseeable the technical success achieved.
